

SUMMARY ON VIRTUAL REALITY

Virtual Reality (VR) is a technology that creates a computer-generated environment where users can feel like they are inside a different world. It allows users to interact with a 3D virtual environment using special devices like VR headsets. VR gives a real-life experience by combining visuals, sound, and motion tracking.

VR works by using a headset that shows 3D images in front of our eyes. It also uses sensors to track the movement of our head and body. When we move, the virtual world also changes accordingly, which makes the experience feel real. Some systems also include controllers and gloves to interact with virtual objects.

There are three main types of Virtual Reality. The first is Non-immersive VR, where we use a computer screen to experience the virtual world. The second is Semi-immersive VR, which provides a partial experience using advanced displays. The third is Fully immersive VR, where users feel completely inside the virtual world using headsets and sensors.

VR systems are made up of different components such as input devices, output devices, and software. Input devices help users interact with the virtual world, while output devices like headsets display the environment. The software controls everything and makes the system work smoothly.

Virtual Reality is used in many fields. In gaming, it provides a realistic experience. In education, it helps students learn better through simulations. In healthcare, it is used for training doctors and treatments. It is also used in military training, architecture, and entertainment industries.

From this workshop playlist, I learned that VR is not only about games but also has many real-life applications. I also understood how VR systems are designed and how they create immersive experiences. It was interesting to learn about how technology can make us feel present in a virtual world.

Overall, this workshop helped me understand the basic concepts of Virtual Reality in a simple and practical way. It also motivated me to explore more about VR and its future applications.
